INTEGRATING YOUR CLOUD APPS FOR SINGLE SIGN ON ACCESS

Integrating Your Cloud Apps For Single Sign On Access

Cloud applications and online services can help you work more efficiently, but not if you end up having to request a new password every time you try and sign in to one of your apps! The more applications and web-based programs you use in your business, the harder it gets to remember your passwords – since you should really never use the same password on more than one application! Intivix developers help businesses manage their various business cloud apps by creating a unique portal that allows access to all of your cloud apps with a single sign on. You and your employees will be able to sign in once to the customized portal and then simply click to access any of your online services from your personalized menu.

Support For Additional Mobile Devices

You can connect other devices to the single sign on service, like smartphones or tablets. This feature allows you to see from your desktop or laptop where your device is located, or wipe the data off the device or lock it - all without assistance from the help desk. These features come in handy if you leave your phone in a cab, for example. Simply lock it or wipe sensitive data from the mobile device from your account on the desktop or laptop computer and you won't have to worry about information on the mobile device getting into the wrong hands.

Single Sign On Access From Mobile Devices

When accessing your single sign on account with your mobile device, you get the same one-click access to each of your cloud applications. In addition, if your company uses customized mobile apps or you want your employees to use apps from iTunes or Google Play, you can add them all to the single sign on portal. If your employee quits or is fired, you can quickly and easily remove all work-related apps without touching the individual's personal apps, photographs or videos on their mobile device from the administrative area of the single sign on program.

Administrative Access

Your IT department or designated manager can manage each of your employees and their access to every cloud app your company uses.

Employees can be added or removed to each app individually, depending on their need for access. This means you can restrict access to data and apps to employees who do not require it.

When you're ready to save time and improve efficiency in your office – contact Intivix to set up a single sign on application for your business.
